### Redis与 Eache 切换文档

#### 前言:

JEECG 默认缓存采用的是 Eache,如何切换 Redis, jeecg 已经提供方案如下,主要修改两方面内容,第一个是 AOP 拦截器,第二个是缓存工具类,具体参考如下:

## 一、切换 AOP 拦截器

# 1.注释 Eache 拦截器

打开org.jeecgframework.core.aop. EhcacheAspect类,如图中红框所示,

注释@Component、@Aspect 注解。

```
🔝 EhcacheAspect. java 🛭
▶ 📸 jeecg ▶ 🎥 src/main/java ▶ 🚜 org.jeecgframework.core.aop ▶ 🕵 EhcacheAspect ▶
    1 package org.jeecgframework.core.aop;
    3⊕ import java.io.Serializable; ...
  189 /**
  19
      * @author 张代浩
  20
  21
      //@Component
      //@Aspect
      public class EhcacheAspect {
          private static Cache eternalCache;
  28 //
   29 //
          static {
   30
              if (eternalCache == null) {
                  eternalCache = CacheManager.getInstance().getCache("eternalCache");
   31 //
   32 //
              if (dictCache == null) {
  33 //
                   dictCache = CacheManager.getInstance().getCache("dictCache");
   34 //
  35 //
  36 //
  37
          @Pointcut("@annotation(org.jeecgframework.core.annotation.Ehcache)")
  389
  39
          public void simplePointcut() {
  40
  41
```

## 2.启用 Redis 拦截器

打开 org.jeecgframework.core.aop. RedisCacheAspect 类,如图中所示,放开@Component、@Aspect 注解。

```
🕡 EhoacheAspect. java 🔑 RedisCacheAspect. java 🛭
▶ 🚟 jeecg ▶ 🎥 src/main/java ▶ 🚜 org.jeecgframework.core.aop ▶ 😭 RedisCacheAspect ▶
   1 package org.jeecgframework.core.aop;
3⊕ import java.lang.reflect.Method;
  19
  200/**
  21 * redis缓存AOP
  22
      * @author Yandong
     @Component
  25
     @Aspect
     public class RedisCacheAspect {
          private RedisTemplate redisTemplate;
  28
  29
  30⊖
          @Autowired
          public void setRedis(RedisTemplate redisTemplate) {
  31
              this.redisTemplate = redisTemplate;
  32
              //泛型设置成Long后必须更改对应的序列化方案
  34
              redisTemplate.setValueSerializer(new JdkSerializationRedisSerializer());
          }
  35
  36
  37⊖
          @Pointcut("@annotation(org.jeecgframework.core.annotation.Ehcache)")
  38
          public void simplePointcut() {}
  39
  40
  419
          @Around("simplePointcut()")
  42
          public Object aroundLogCalls(ProceedingJoinPoint joinPoint)
                  throws Throwable {
  43
```

## 二、切换缓存工具类

找到系统中使用 org.jeecgframework.core.util. EhcacheUtil 类操作缓存的地方,替换成 org.jeecgframework.core.util. RedisCacheUtil 类 操作缓存(全文搜索替换)。

至此就完成了 Eache 缓存切换到 Redis 缓存了,如果想从 Redis 缓存切换回 Eache 缓存把上述操作反过来既可。
